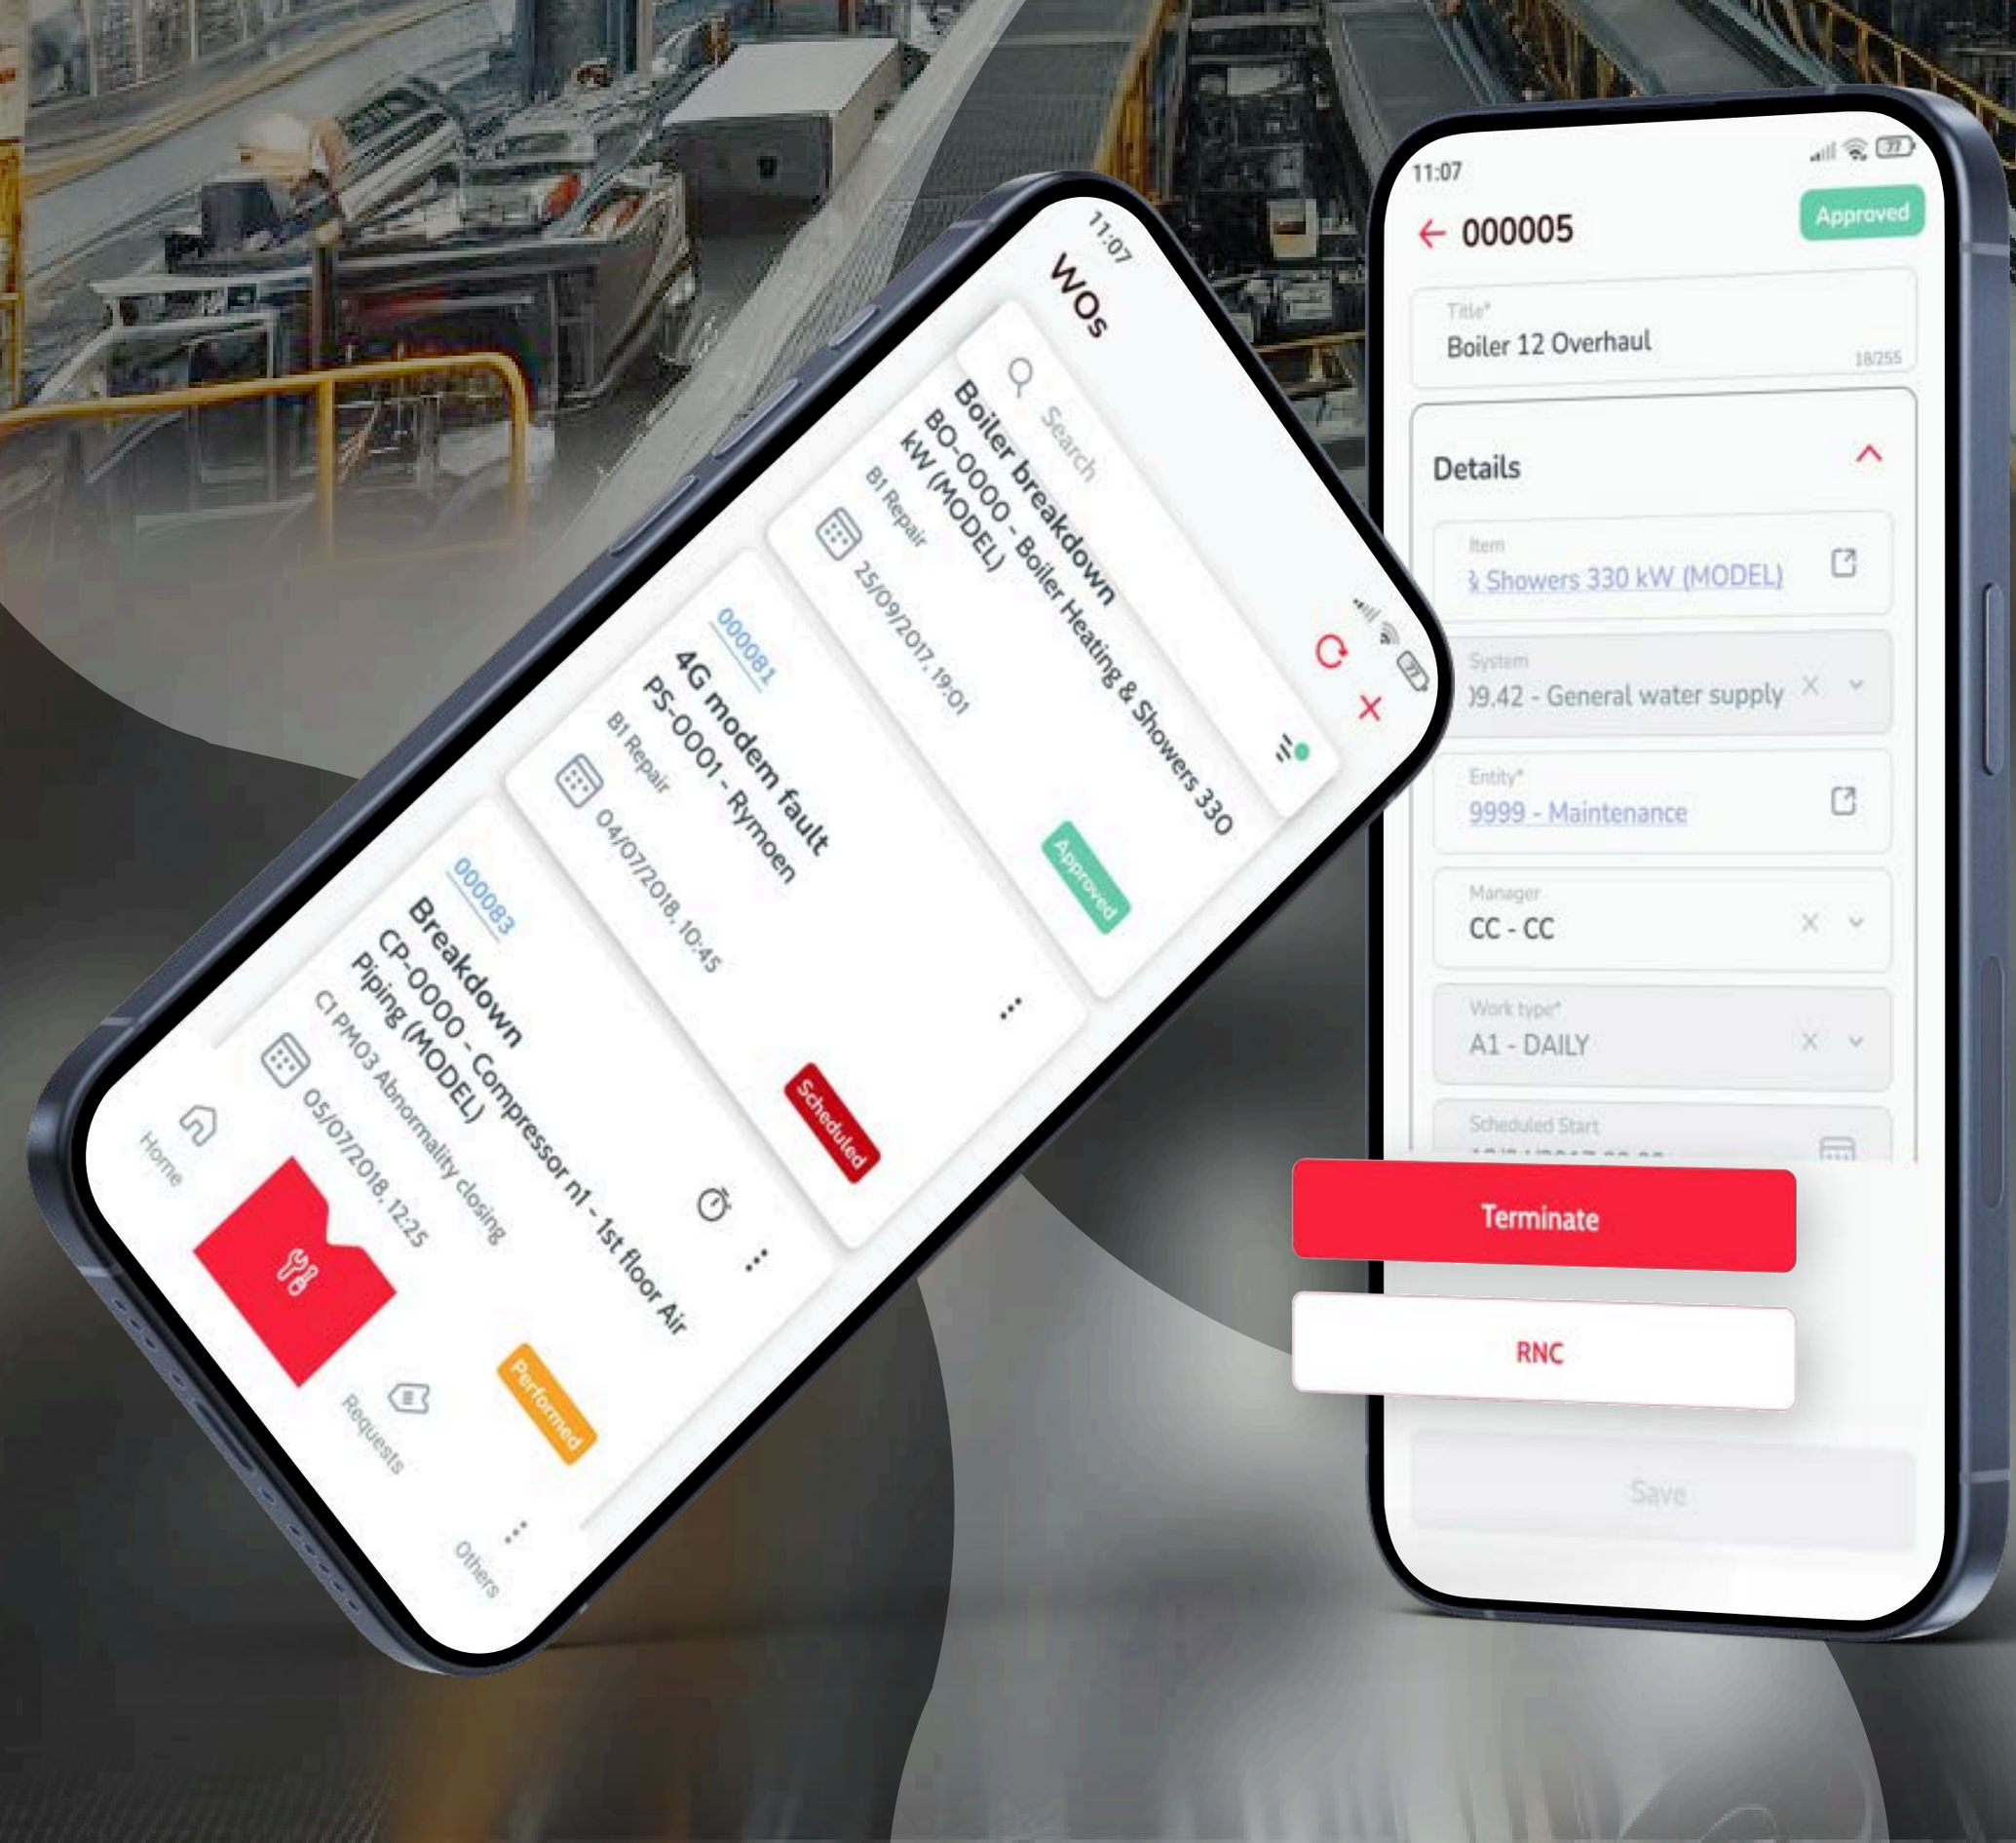
MANWINWIN

Maintenance, made Smarter. Easier. Anywhere. Anytime.



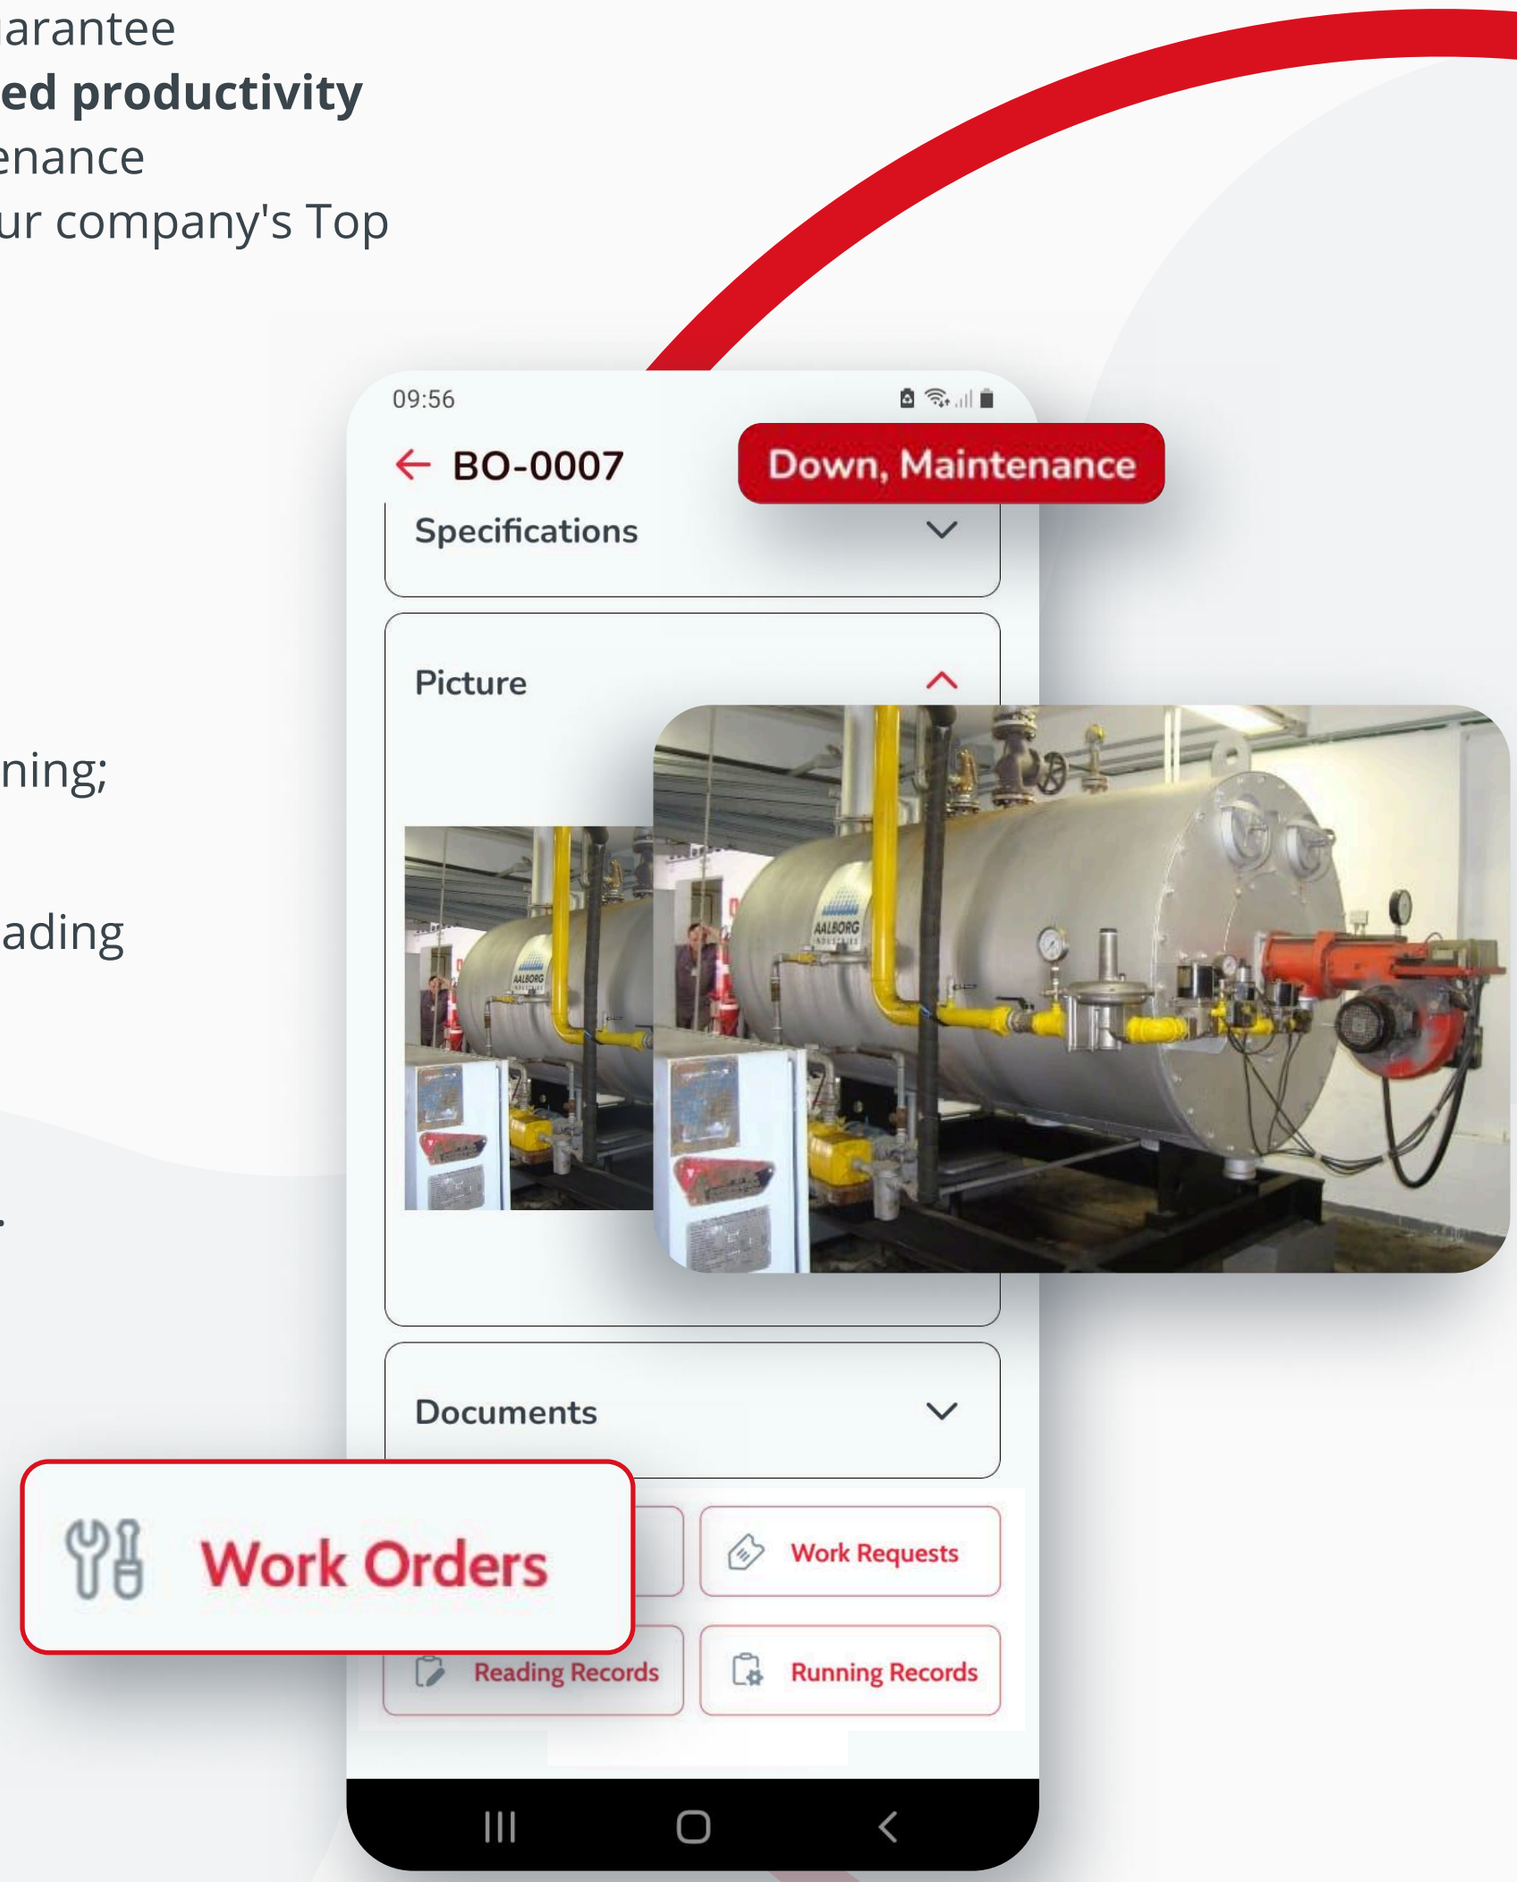
Mobile access made simple

When software is easy to use, people use it. The simplicity of the ManWinWin app encourages adoption and offers technicians a smooth, intuitive experience.

Your maintenance team will easily record all the necessary information in real time, which will guarantee a **paperless experience and increased productivity for your team**, and important maintenance data for analysis and reporting for your company's Top Management.

A single APP allows you to make:

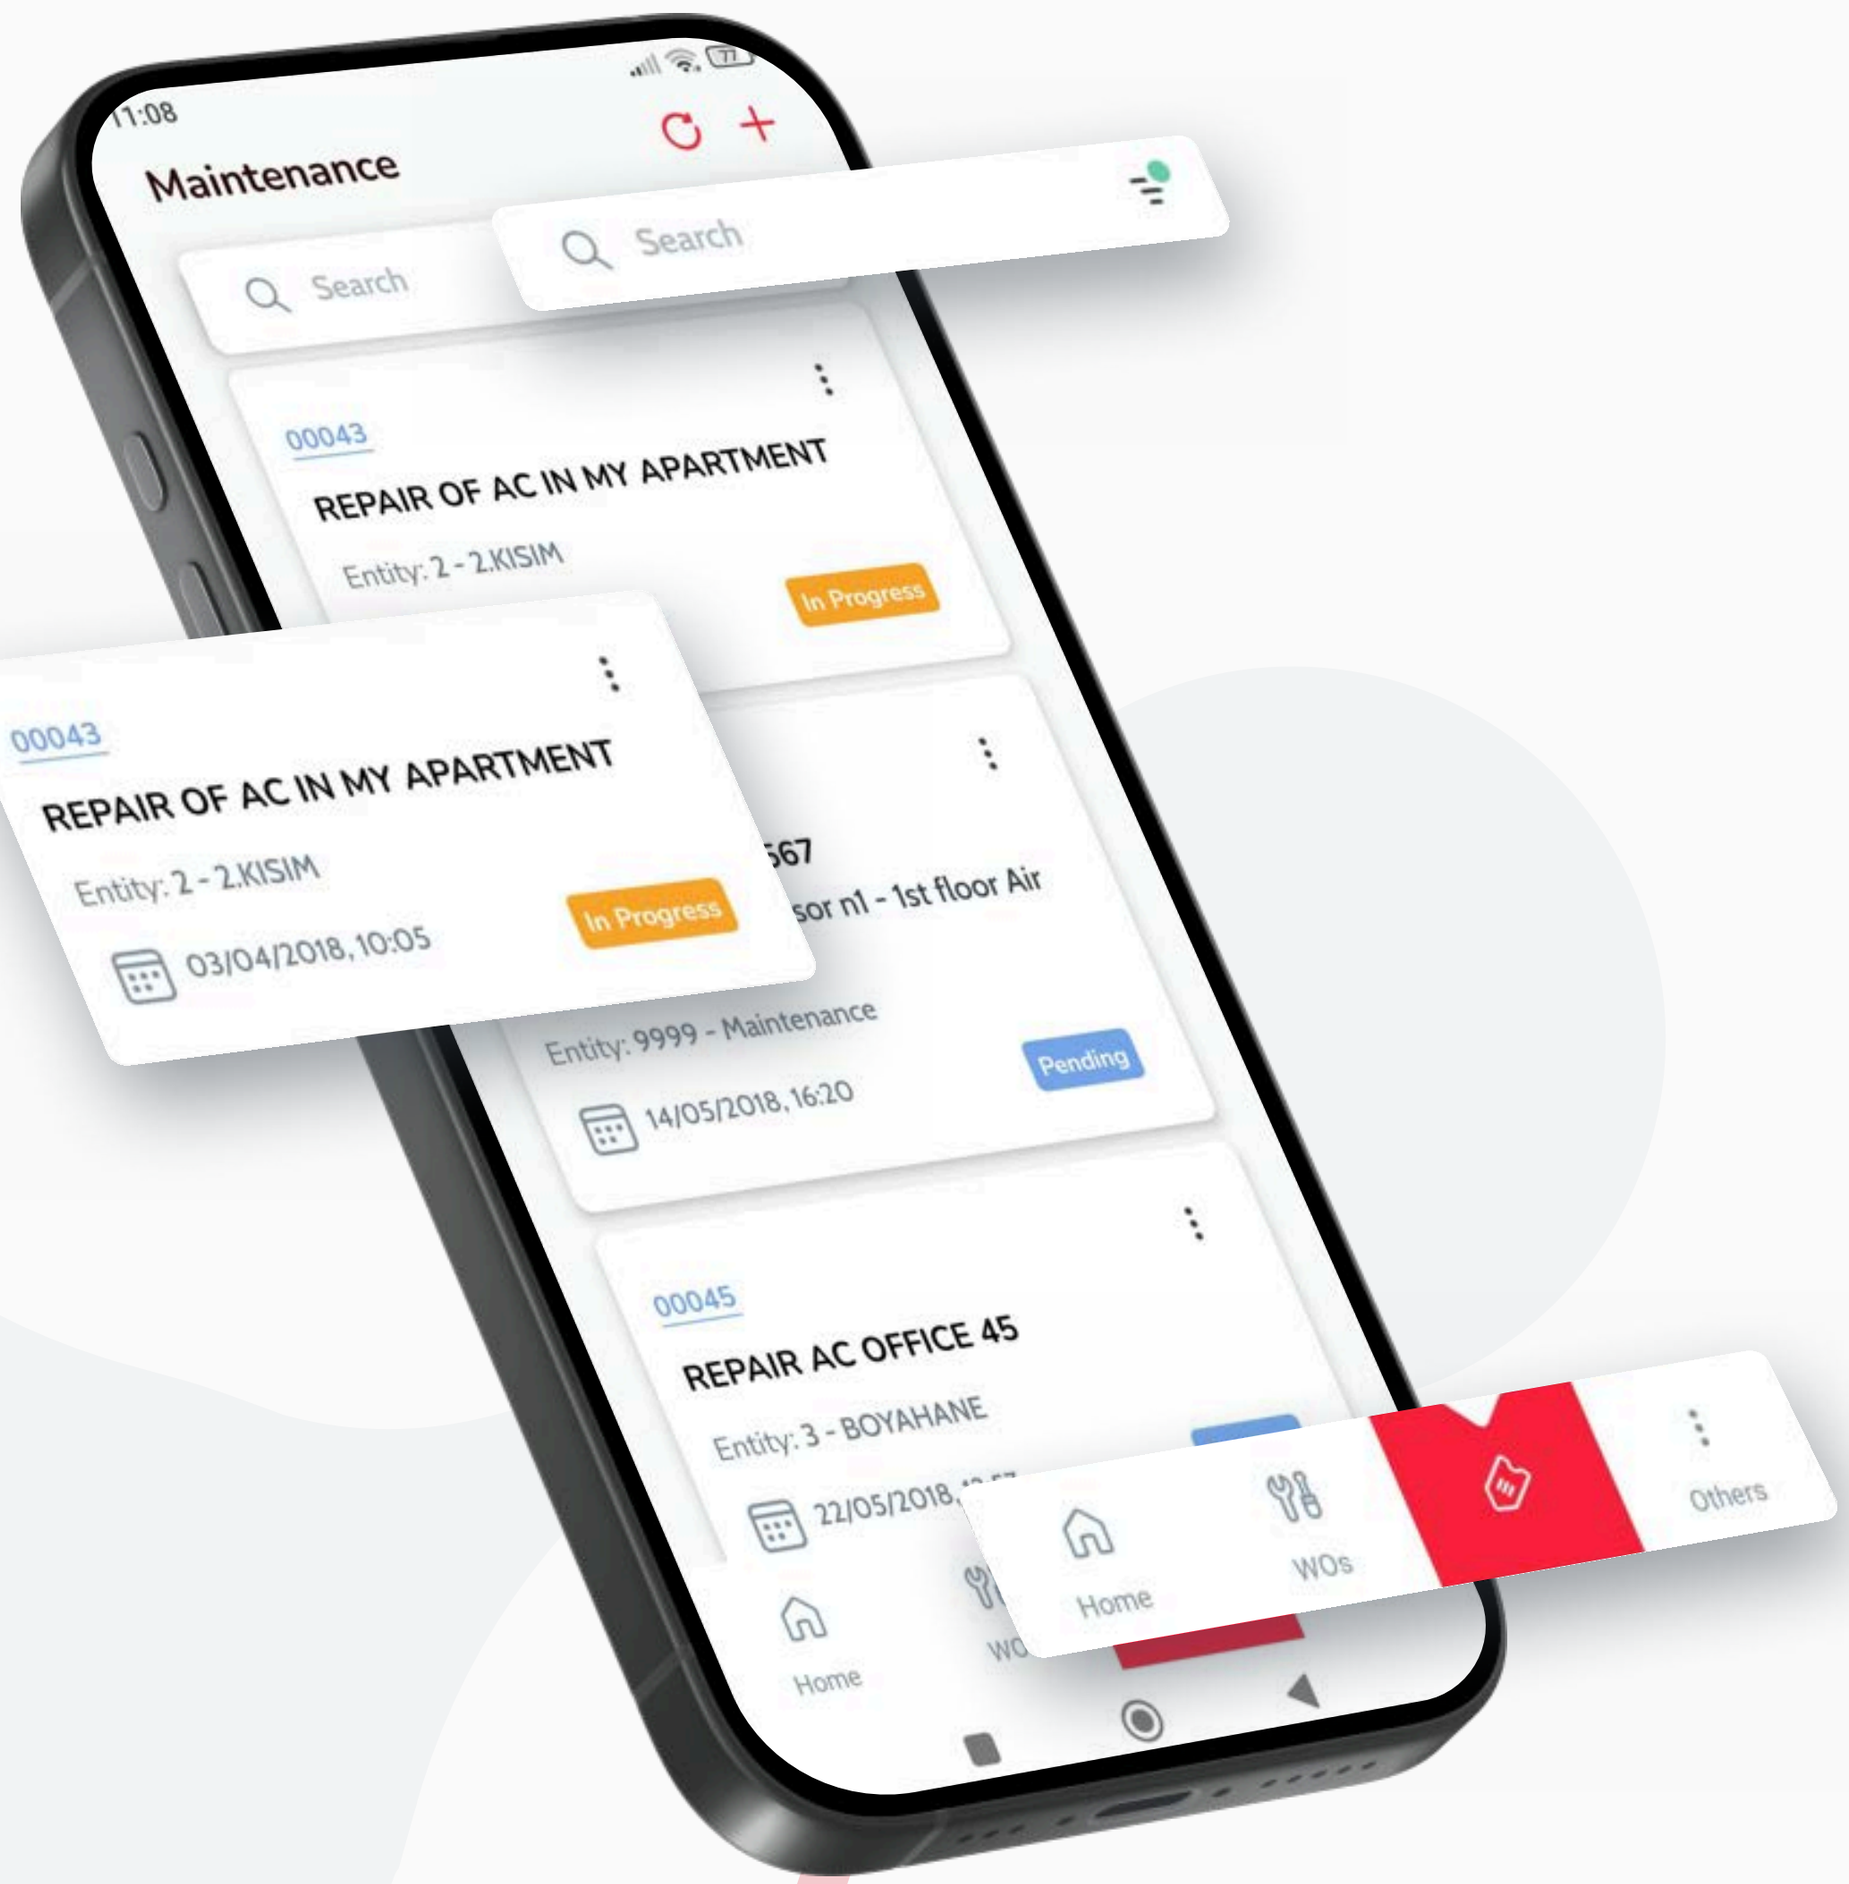
- Maintenance requests;
- Perform and report work orders;
- Check stocks in the warehouse;
- Stock inventory with codebar scanning;
- Create new equipment;
- Register running records or any reading point;
- Perform any operation directly on a specific equipment or system by scanning a **QRcode** or **NFC tag**.



Assign priorities

Keep tasks clear for your maintenance team.

The APP's homepage shows the user's pending work and necessary actions to be taken. A simple and straightforward screen that facilitates the day to day of field technicians.



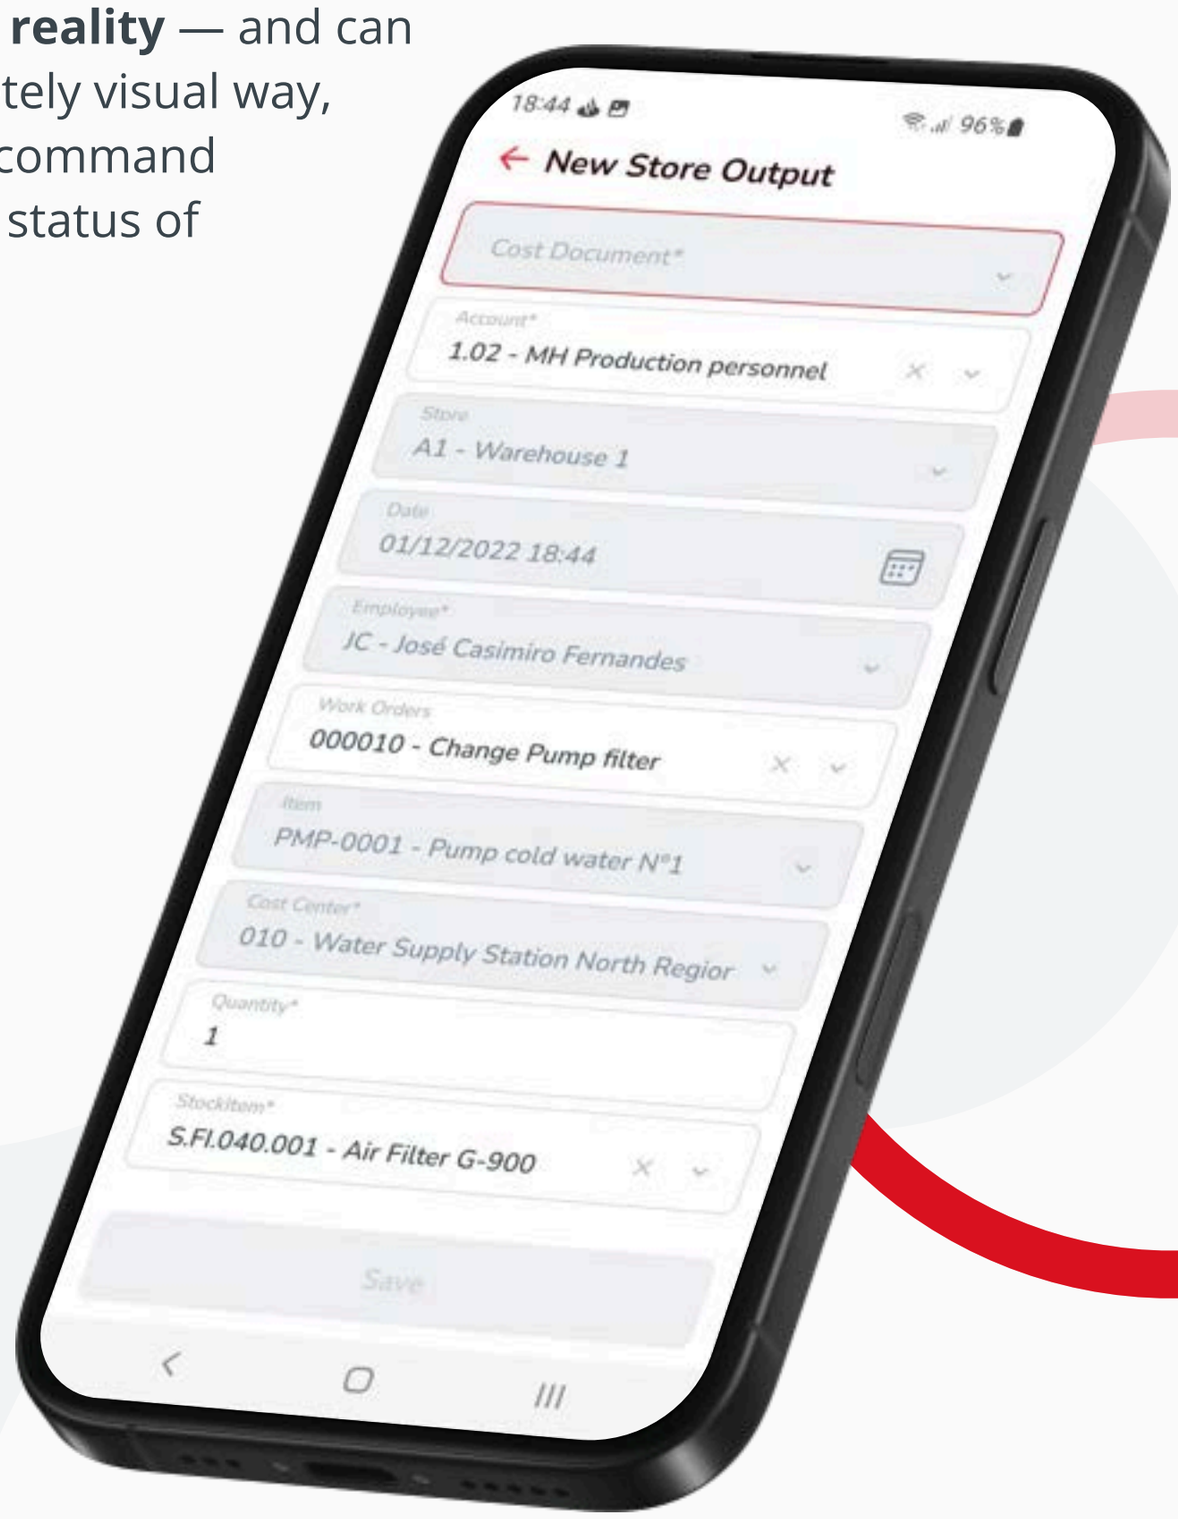
Make it easy for your team

Start/stop function & augmented reality.

The work order list allows you to easily track the status of each job. **Each operator accesses their jobs and completes them**, reporting time and materials used, by simply stocking out from warehouse or from a direct purchase.

When carrying out tasks, the operator has access to additional information — **augmented reality** — and can choose to carry out the work in a completely visual way, using real images of the equipment and command components and alerts on the execution status of each task.

The recording of time spent on each operation can be done in real time with the **start/stop feature in the APP** itself or, later, with a manual record.



Communication and collaboration

Any machine operator or maintenance technician can place and manage all their requests from one single access.
The APP has the necessary resources to manage:

Maintenance requests

To report faults to the maintenance team, with the possibility of associating a photograph and detailing the occurrence in real time.

Purchase requests

When it is necessary to request the purchase of an item that does not exist in stock or that is intended for direct application in a work order.

Warehouse requests

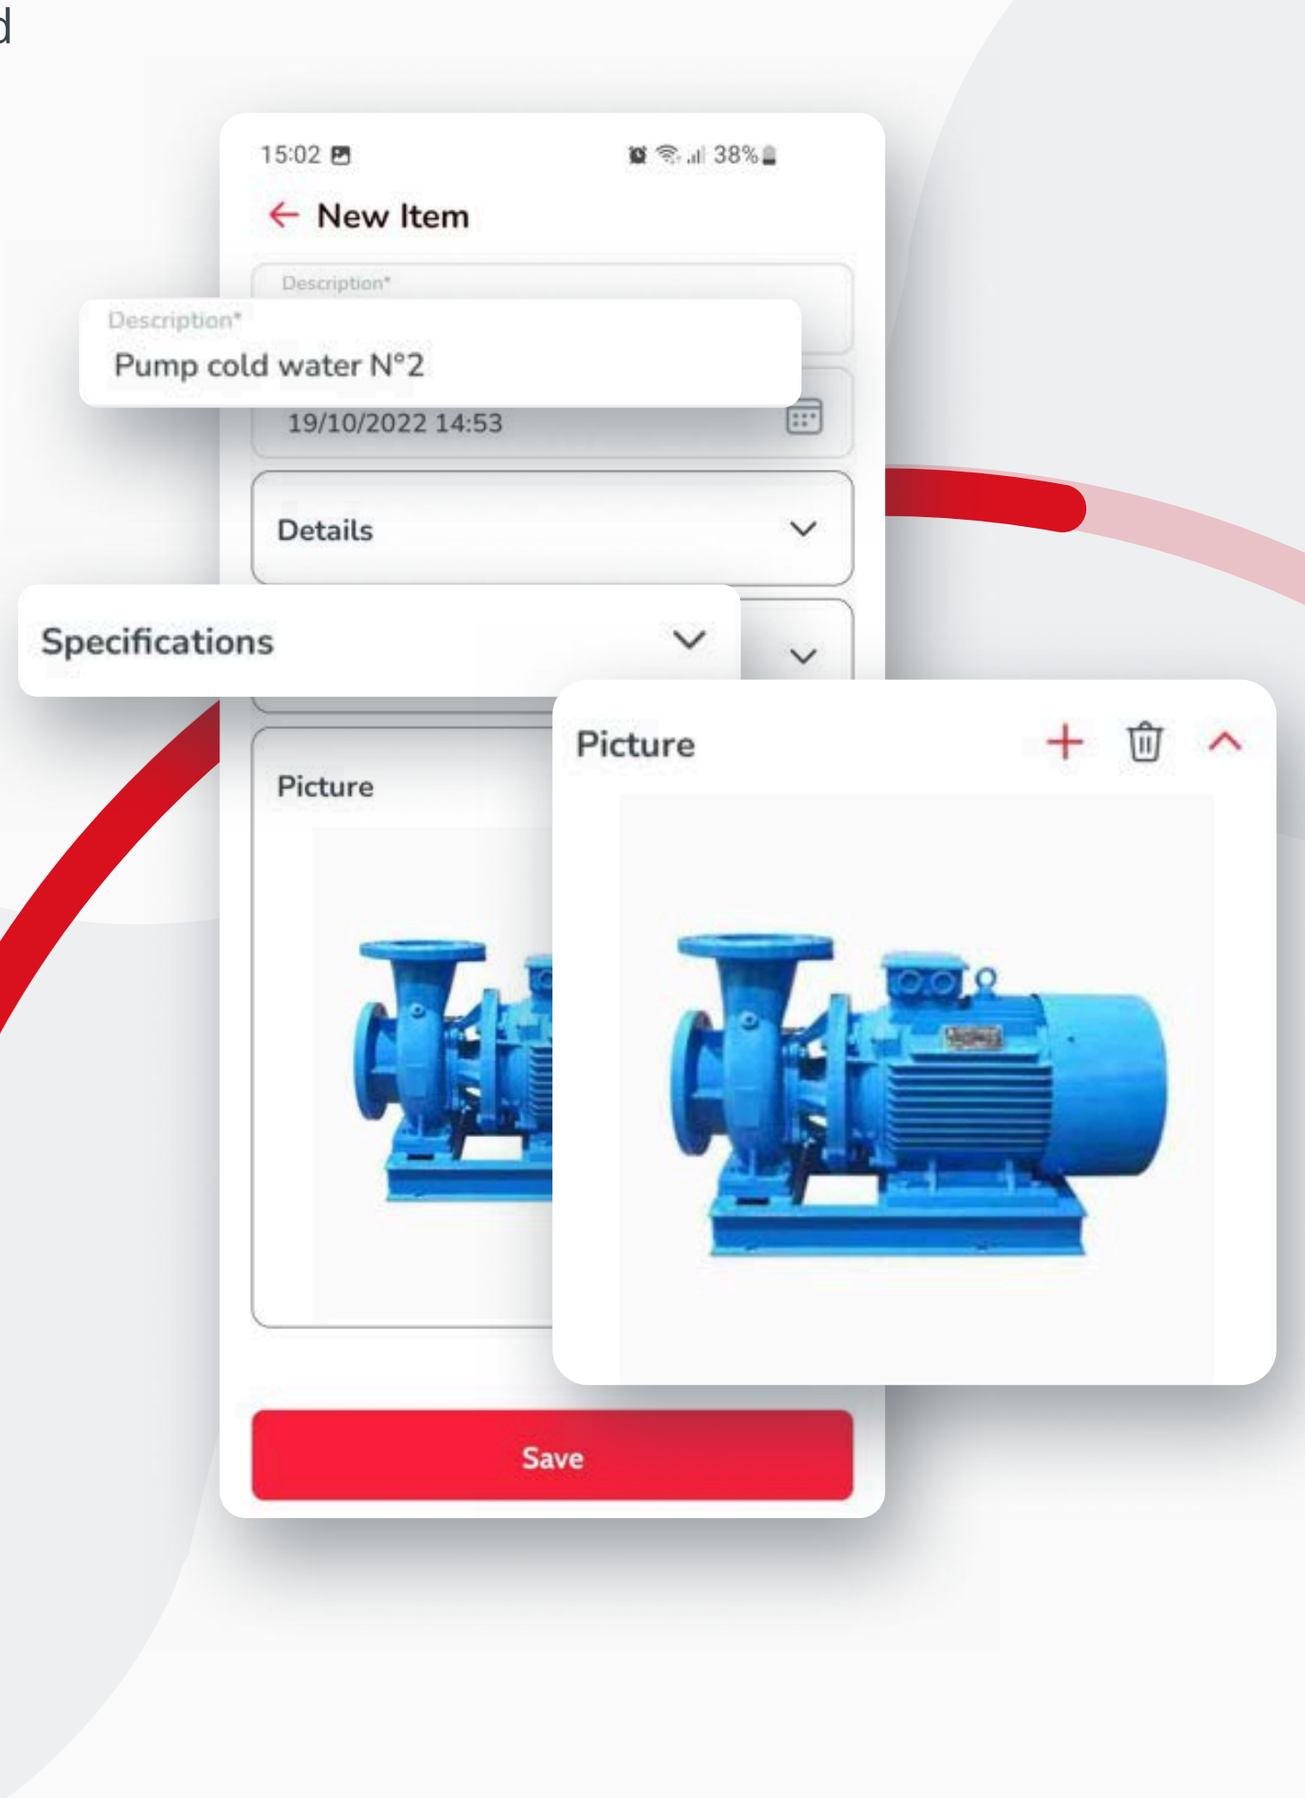
For those who want to manage the requests for items needed to carry out the work.

Streamline maintenance operations

Using short-range wireless technology.

NFC Tags **QR codes**

With the **ManWinWin App**, you can view and search your equipment list, including technical details and files. By scanning a **QR code** or **NFC tag**, you access specific equipment data and tasks instantly. You can also **create new equipment** records with full details and photos — anytime, anywhere.



Optimized tracking

Stay on top of your materials and warehouse operations anywhere, anytime.

Warehouse management

ManWinWin APP allows you to access all available warehouses with detailed information on current stock levels, unit costs, and recent movements of each item in stock. There are also resources for warehouse consumption and direct purchase material for Work Orders.
